

## HyD Detectors (in place of PMT2 and PMT4)

**When to use HyD Detectors?** If your sample is very dim, you may want to use HyD detector to collect your signal.

**Do not use high laser with HyD detector:** use as low laser as possible (1%-max 20%)

**PMT 2 and PMT 4 are now replaced by HyD detectors which provides:**

- Large Dynamic range
- Improved cell viability
- High speed Imaging
- Single photon counting
- Low dark noise
- Exquisite contrast

### ADJUSTING THE PARAMETERS FOR HyD's

**Gain adjustment: can go from 0-500**

Increase "Smart gain" until just a few single blue dots appear (saturated pixels=value 255).

**Offset adjustment:**

Sets automatically in HyD

**Leica HyD has 3 modes of collection:**

- 1) Standard mode (most commonly used)
- 2) BrightR (rarely used, non-linear gain applied to structure, non-quantitative)
- 3) Photon Counting Mode (good for quantitative imaging; works best with dim sample)

**For more information you can also check this website on HyD.**
